Tips and Tricks for a Green Lawn

Save money, use less water, apply fewer pesticides and fertilizers, and avoid common lawn problems.

$\frac{1}{3}$

Remove no more than one-third of the grass blade during each mowing. A slightly taller blade shades the soil, holding in moisture. It also prevents weed growth.

When grass is growing slowly, raise the mowing height and cut it less often. If your grass is growing quickly, mow more often.

Leave grass clippings on the lawn. Besides personal preference, there is no reason to remove them. They recycle nutrients and water back to your lawn and improve the top soil.

Mow when the grass is dry.

Keep your mower's blades sharp and clean. Lawns cut with dull blades lose moisture faster and are more prone to disease.

Mow over leaves so that they will decompose along with the grass clippings. Consider using mulching blades to shred clippings and leaves.

Change your mowing pattern regularly to distribute grass clippings evenly and prevent ruts or irregular growth patterns.
